

BHARGAV SANTOSH GAJARE

Mumbai, India | +91 72083 91944 | gajarebhargav@gmail.com | [linkedin.com/in/bhargavsg](https://www.linkedin.com/in/bhargavsg) | github.com/bhargavgajare1479 | bhargavsg.vercel.app

SUMMARY

Software Engineer with experience across full stack systems, real-time application architecture, and low-level data processing, built across multiple domains. Comfortable moving between infrastructure work, performance-critical application systems, and building tools from scratch without relying on external libraries. Focused on understanding a problem properly before writing code, and on making sure whatever gets built actually holds up when it's running.

EXPERIENCE

Project Intern (AR/VR) | IITI Drishti CPS Foundation, IIT Indore Jun, 2026 - Present

- Design performance-critical simulation systems under strict hardware and memory constraints, translating client requirements into engineering trade-offs across rendering and interaction logic.
- Improved system throughput by 40% and cut computational overhead by over 50% through algorithmic culling, asset-level compression, and static batching techniques.
- Engineer real-time input and locomotion systems in C#, maintaining strict performance budgets through continuous profiling and iterative optimization.

Software Developer | Sorxn LLP Jan, 2026 - Jun, 2026

- Built and validated a backend infrastructure prototype from the ground up - RESTful API systems, PostgreSQL database integration, deployment pipelines, and a self-hosted Linux communication stack with Cloudflare-based traffic routing and tunnel-based secure remote access, sustaining 150+ concurrent requests before handoff to production.
- Architected and self-hosted the company's infrastructure stack on Linux, implementing secure tunnel-based routing to eliminate dependency on managed third-party services.
- Built a full-stack internal platform (Next.js, Supabase) with JWT-based authentication and role-based access control, enforced across every system layer.

Software Developer Intern | Sorxn LLP Dec, 2025 - Jan, 2026

- Delivered feature development across two production codebases (internal platform and public website), carrying work from implementation through to release.
- Owned the end-to-end production deployment process - DNS configuration, environment setup, and go-live for the company's public-facing website.

Unity Developer | Vighnesh Inc. Jun, 2024 - Dec, 2025

- Engineered a modular, dependency-free integration layer in C# to replace a third-party SDK, resolving a major compatibility constraint and improving system portability across platforms.
- Designed a state management architecture spanning 500+ application screens, enforcing deterministic transitions and eliminating an entire class of concurrency bugs.
- Built a custom lifecycle manager using active state tracking and instance reuse, cutting peak memory consumption and load latency by over 50% across a 10+ module application.

Software Developer Intern | Vighnesh Inc. May, 2023 - Jan, 2024

- Implemented backend-integrated modules in PHP, connecting server-side logic to real-time application state.
- Diagnosed and resolved cross-platform rendering bottlenecks, unblocking deployment on resource-constrained hardware through systematic performance profiling.

PROJECTS

Unearth | [Website](#) | [GitHub](#) | Python Aug, 2025 - Present

- Engineered a filesystem forensics platform from first principles - low-level binary parsing, deleted-data recovery, and artifact reconstruction via signature-based carving with zero external dependencies, along with an intelligent misinformation detection system powered by LLM integration.
- Built automated data-integrity pipelines (SHA-256 verification, metadata extraction, timeline reconstruction) and shipped both CLI and GUI interfaces for distinct user workflows.

SerenitySphere | [GitHub](#) | Unity, C#, OpenXR, XR Interaction Toolkit Oct, 2024 - Mar, 2025

- Built a real-time interactive application balancing visual fidelity against strict runtime performance constraints, using systematic profiling to hold stable frame rates on constrained hardware.
- Top 40 Finalist, national-level Creator Hackathon (Ministry of Information & Broadcasting, Govt. of India); presented at the finale, Jio World Centre, Mumbai.

AR Application: HomewiseVision | [Website](#) | [GitHub](#) | [Research Paper](#) | Unity, Firebase, C#, Python, Vuforia SDK Jan, 2024 - Apr, 2025

- Built a mobile application with cloud-backed authentication, data sync, and persistent session state management across dynamic user interactions.
- Applied multiple linear regression for cost estimation, integrating a third-party spatial-mapping API for scalable model generation.
- Published in IRJET (Vol. 11, Issue 2); 1st Place: AI SPARK 2025, Judges' Choice Award: U'LECTRO 2025, plus two additional collegiate placements.

SKILLS

Programming Languages: C#, Python, JavaScript, SQL

Frameworks and Tools: Next.js, Tailwind CSS, Express.js, Firebase, Supabase, Linux, Cloudflare, FastAPI, Numpy, Pandas, Seaborn, Unity, Git, Docker

Concepts: REST API Design, Authentication & Authorization (JWT, RBAC), Database Design, Asynchronous Programming, OOP, Data Structures, Memory Management, Concurrency & State Management, Performance Optimization, System Design

EDUCATION

NYSS's Datta Meghe College of Engineering Sept, 2024 - Expected May, 2027
B.E. in Artificial Intelligence and Data Science - 7.32 CGPA | Navi Mumbai, India

Zagdu Singh Charitable Trust's Thakur Polytechnic Oct, 2021 - Jun, 2024
Diploma in Computer Engineering - 86.97% | Mumbai, India
